

The Nobel Prize in Physics for the year 2014 was announced today on 7th October. It has been jointly awarded to three pioneers, *Isamu Akasaki*, *Hiroshi Amano*, and *Shuji Nakamura* for the invention of efficient blue light emitting diodes which make bright and energy saving white light sources possible.

2014 NOBEL PRIZE IN PHYSICS

The Prize amount, SEK 8 Million will be shared by the laureates equally. This year also marked the 275th anniversary of Royal Swedish Academy of Sciences.

Here is an attachment of the original document released by The Nobel Prize.org.

The Red Led was invented around early 1960s and then a few years later green Leds were also invented. But the Blue Led was difficult to make. They arrived in 1990s. Their invention made the mixing of the three Leds to produce white light possible, which was demonstrated in the Nobel Prize winning Presentation.

Manas Sharma

I'm a physicist specializing in computational material science with a PhD in Physics from Friedrich-Schiller University Jena, Germany. I write efficient codes for simulating light-matter interactions at atomic scales. I like to develop Physics, DFT, and Machine Learning related apps and software from time to time. Can code in most of the popular languages. I like to share my knowledge in Physics and applications using this Blog and a YouTube channel.
